

Abstract

A method and system are directed at automatically tuning a TCP receive window (RWIN). The size of the RWIN may be determined by attributes of a network card. One attribute used to size the RWIN is the speed of the adapter card. The adapter speed is readily available by polling the network card. Once the speed is known, the size of the RWIN is selected from a table and is automatically set. Alternatively, the size of the RWIN may be determined by a formula.
